Advanced Surface Passivation of Silicon Solar Cells

Combining in-depth material science know-how with advanced device simulation to optimise the performance of silicon solar cells by applying thin surface passivation layers.

Competitive advantage

- World-class understanding of device-relevant fundamentals
- Capability to synthesise a wide range of surface passivation materials/stacks in-house
- Field-leading characterisation capabilities
- The first to develop a method for extracting the quantity of charge in dielectrics on doped silicon surfaces

Impact

- As the surfaces of a silicon solar cell typically contribute the highest efficiency loss, this optimisation improves their long-term performance.

Successful outcomes

- One of the main pioneers in the development of aluminium oxide which is now the de facto standard used in PERC solar cells
- Worked with various non-disclosed equipment suppliers and solar cell manufacturers to optimise surface passivation using their unique technologies
- Developed an intrinsically safer process for the deposition of aluminium oxide surface passivation films
- Currently unravelling the surface passivation fundamentals of complex three-dimensional structures such as those used for black silicon

Capabilities and facilities

- Access to and experience in state-of-the-art device simulation tools
- In-house laboratory and pilot-scale thin film fabrication capabilities for a wide range of surface passivation films

Our partners

- Leadmicro, a leading equipment manufacturer from China
- A number of non-disclosed solar cell manufacturers
